

SALES & REVENUE ANALYSIS DASHBOARD

Business Intelligence & Data Visualization Project

Prepared by	Misbah Naqvi
Programme	Master of Business Administration (MBA)
Institution	Babu Banarasi Das University, Lucknow
Academic Session	2025–26
Platform	Microsoft Power BI

Project Purpose

To design an interactive sales and revenue dashboard that converts transactional data into KPIs, trends, product performance analysis, regional comparisons, and actionable business insights.

Important: The numerical results and charts in this report use an illustrative dataset created to demonstrate the project workflow. Replace the source data with a faculty/company dataset if one has been assigned.

1. Executive Summary

The Sales & Revenue Analysis Dashboard provides a single management view of sales performance. It combines data preparation, KPI tracking, revenue trends, product rankings, category analysis, regional comparison, and interactive filtering. Microsoft Power BI is recommended because it supports Power Query, DAX measures, slicers, drill-downs, and interactive reports.

The illustrative analysis covers January–December 2025 and demonstrates how managers can identify revenue patterns, high-performing products, profitable categories, and regions requiring attention.

Objectives

- Import Excel/CSV sales data into Power BI.
- Clean and transform raw transactional data.
- Create KPIs for revenue, profit, orders, units, average order value and margin.
- Build interactive charts, filters and slicers.
- Identify top-performing products, categories and regions.
- Generate business insights and recommendations.

2. Data Source & Methodology

The project uses an illustrative order-level dataset suitable for Excel or CSV import. Each record contains order date, product, category, region, quantity, unit price, discount, revenue, cost and profit.

Data Preparation Workflow

Load the source file through Power BI → Get Data.

Use Power Query to correct data types and remove duplicates.

Check missing values and validate numeric fields.

Create Year and Month fields for time-series analysis.

Validate Revenue and Profit calculations.

Build the analytical model and connect measures to report visuals.

Field	Purpose
Order ID	Unique transaction identifier
Date	Time-series analysis
Product	Product performance
Category	Category comparison
Region	Geographical comparison
Quantity	Units sold
Unit Price	Price per unit
Discount	Discount applied
Revenue	Net sales value
Cost	Estimated cost
Profit	Revenue minus cost

3. Dashboard Overview

■6,227,941	■1,980,532	660	1,935
Total Revenue	Total Profit	Orders	Units Sold

Dashboard visual layout

Top row: KPI cards. Middle: monthly revenue trend. Lower section: category, product and regional performance. Side panel: Year, Month, Region, Category and Product slicers.

4. Dashboard Visuals

Monthly Revenue Trend

Revenue by Category and Region

5. Product Performance

Top 10 Products by Revenue

Category	Revenue	Profit	Margin
Electronics	■2,485,751	■804,556	32.4%
Home & Kitchen	■1,305,804	■405,465	31.1%
Sports	■993,123	■325,247	32.7%
Apparel	■921,510	■274,135	29.7%
Beauty	■521,754	■171,130	32.8%

6. KPI Framework & Power BI Measures

KPI	Definition	Business Use
Total Revenue	SUM(Revenue)	Overall sales value
Total Profit	SUM(Profit)	Contribution after cost
Orders	Distinct Order ID	Transaction volume
Units Sold	SUM(Quantity)	Product movement
Average Order Value	Revenue ÷ Orders	Average transaction size
Profit Margin	Profit ÷ Revenue × 100	Profitability
Revenue Growth	(Current – Previous) ÷ Previous × 100	Period performance

Recommended DAX measures

Total Revenue = SUM(Sales[Revenue])

Total Profit = SUM(Sales[Profit])

Total Orders = DISTINCTCOUNT(Sales[Order ID])

Average Order Value = DIVIDE([Total Revenue], [Total Orders])

Profit Margin = DIVIDE([Total Profit], [Total Revenue])

These measures respond dynamically to slicers and filters.

7. Business Insights & Recommendations

Overall performance: Illustrative revenue is ■6,227,941 across 660 orders, giving an average order value of approximately ■9,436.

Profitability: Illustrative profit is ■1,980,532, with an overall margin of 31.8%. Revenue should therefore be evaluated together with margin.

Category leader: Electronics is the highest-revenue category in the illustrative dataset.

Regional leader: North generates the highest regional revenue and should be evaluated for repeatable growth drivers.

Product leader: Power Bank is the top product by revenue and should be monitored for inventory, pricing and promotion opportunities.

Seasonality: April is the strongest revenue month while January is the weakest in the illustrative period.

Recommendations

- Prioritize availability of high-revenue products.
- Investigate underperforming regions and months before increasing promotional spend.
- Track profit margin alongside revenue when assessing discounts.
- Use slicers to move from company-level performance to product-level diagnosis.

8. Interactive Filters & User Journey

Slicer	Example Values	Purpose
Year	2025	Period selection
Month	Jan–Dec	Monthly drill-down
Region	North/South/East/West	Regional analysis
Category	Five product categories	Category analysis
Product	Individual products	Product analysis

- Start with KPI cards for the performance snapshot.
- Review the revenue trend for changes over time.
- Compare category, product and regional performance.
- Apply slicers to isolate a market, product or period.
- Record the reason for major changes and the recommended management action.

9. Conclusion

The Sales & Revenue Analysis Dashboard demonstrates how transactional data can be transformed into a practical business intelligence report. KPIs provide an immediate performance snapshot, while trends, product rankings, category comparisons and regional analysis explain what is driving results.

Power BI is an appropriate platform because Power Query supports data preparation, DAX supports dynamic business measures, and slicers/visual interactions support exploratory analysis. The same design can be connected to a real Excel, CSV or database source.

Expected Learning Outcomes

- Understanding the end-to-end business intelligence workflow.
- Cleaning and transforming sales data.
- Creating KPI measures and interactive visualizations.
- Using slicers and filters for exploratory analysis.
- Interpreting business trends and product performance.
- Converting findings into management recommendations.

Submission note: This report is ready as a project document. The included figures are based on an illustrative dataset; for a faculty-required live Power BI submission, use the supplied dataset and recreate the same dashboard structure.
